

Bendix King KA 285 Pilots Guide

Autopilot Annunciator

Filename: **BendixKingAP20!KA285_JD**

The KA 285 Autopilot Annunciator displays the operating mode of any autopilot system. The KA 285 was developed for use with the KFC 200 autopilot system, but see Note 1 below.

When a system test is performed on the autopilot, all indicators will be illuminated.

When the autopilot is disengaged and no autopilot modes are selected, or when all power is removed from the system, no indicators will be illuminated.

The KA 285 has marker beacon indicators. (In real life these are indicators only, and require an external marker beacon receiver to operate).

Note 1. The KA 285 is most useful with an autopilot with no internal mode indications like the KFC 200, where it becomes a vital part of the system.

The KA 285 will also work perfectly with the JD Bendix King KAP 150, KFC 150, KAP 140, KFC 225 and KAS 297B.

The KA 285 will also work with the Flight simulator default autopilot, and any other third-party autopilot, except that no test function will be provided, and the GA and TRIM indicators will not illuminate.

Note 2. There is no Vertical Speed (VS) indication on the KA 285. VS indication is provided by the host autopilot or KAS 297B.
